SCJP MATERIAL

- 1) Introduction
- 2) assert as keyword & identifier
- 3) Types of assest statements
- 4) Various possible lunitime flags
- 5) Appropriate 4 inappropriate use of assertions.
- 6) Assertion Error.

# 1. Introduction:

- The problem with Sop is after fixing the bug compulsory we have to delete entra added Sops, o.w. These will be enecuted at runtime which creates performance problems and disturbs server logging.
- To overcome these problems sun people introduced Assertions concept in 1.4 version.
- The main advantage of assertions over S.o.ple is after fixing the buy we are not required to delete assert statements becox they won't be executed by default at suntime.
- Based on our requirement ne can enable or disable assertions and by default assertions are disable.
  - Osually we can perform debugging either in Development of Test environment, but not in production.
    - -> Hence assertions concept applicable only for development & testrenvisorments, but not for Production.
  - -> Hence the main objective of assertions is to perform debugging as afternative to S.o.p's.

SCJP MATERIAL

2. assert as keyword and identifier:

- -> assert keyword introduced in 1.4 version.
- -> Hence from 1.4 version onwards we can't use assert as identifier.

En: class Test

P s v m(-)

{
int assest = 10;

S.o.p(assest);

javae Test. javat

ce: as of release 1.4, 'assert' is a keyword and may not be med as an identifier (use -source 1.3 or lower to use 'assert' as an identifier.

javac - source 1.3 Test. javael

compiles fine with warnings DEMO

July 1 - Souther 1.4 Text.

javac - source 1.3 Test. java javac - source 1.2 Test. java

Note: (1): We can compile a Java program according to a particular version by using — source option.

2) If we are using assert as identifier and if we are trying to compile according to old versions (1.3 or lower) then the code compiles fine but will warnings.

3. Types of owsert statements:

-> There are 2 types of assert statements.

1. Simple version

2. Augmented version.

1. Simple version:

Syntan:- assert (b); should be boolean)

If is true then one assumption satisfy and hence rest

if b is false then our assumption fails of hence some where something goes wrong due to this the program will be terminated abnormally by raising Assertion Errol.

SCJP MATERIAL

4. Various possible runtime flags:

- 1) -eal-enableassections: To enable assections in every non-eyetem classes (our own classes).
- 2) -dal-disable assertions: To disable assertions in every non-system classes.
- 3) -esa/-enablesystemassertions: To enable assertions in every system dass (predefined classes).
- 4) -dsaf-disable eystemassertions: To disable assertions in every eystem dans.

Note: - We can use above flags simultaneously then IVM will consider these flags from left to right.

Ez: java -ea -esa -da -ea -esa -da -dsa -ea Testel

Non-system

System

X

X

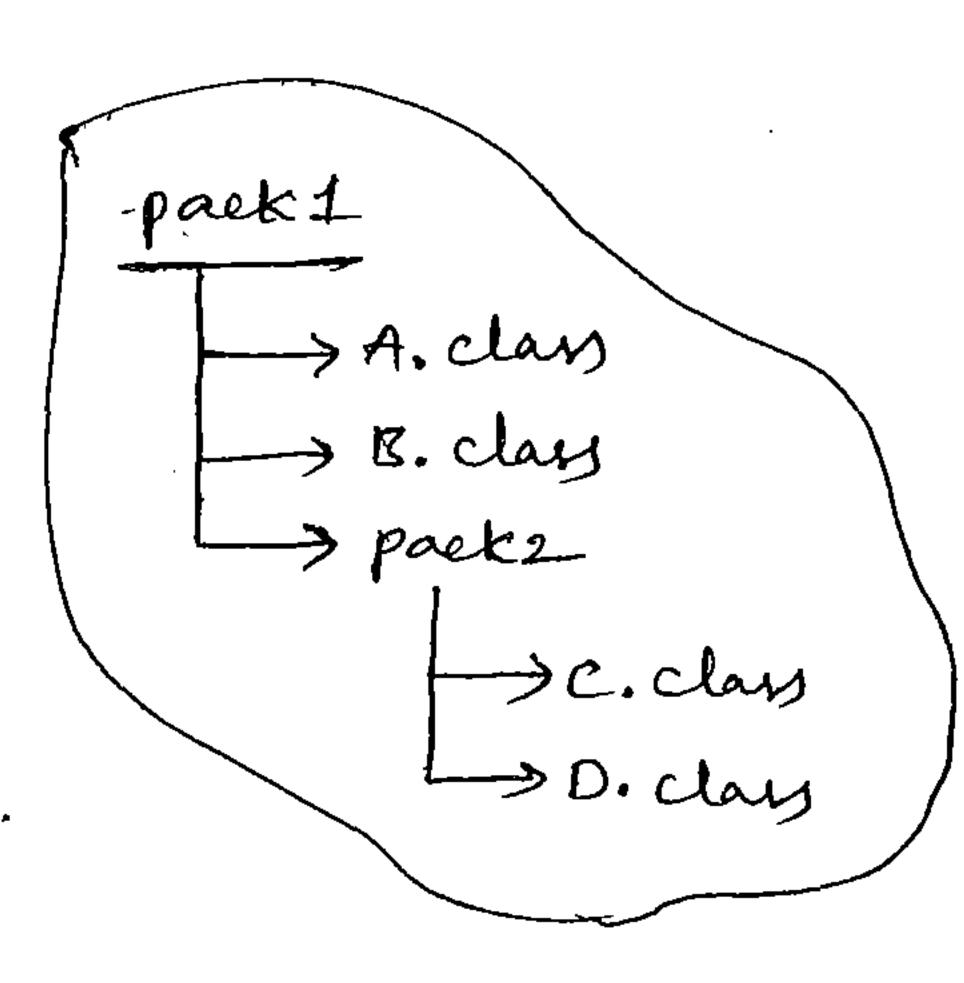

Case Study:

1). To enable assertions only in B class.

java -ea: paek1.B

- Java -ea: paek1.B -ea: paek1.paek2.0
- 3) To enable assertions every where inside pack1.

  java -ea: pack1...

- 4) To enable assertions every where inside pack1 except pack2 classes, java -ea:pack1... \_da:pack1.pack2...
- 5) to enable assertions every where inside pack1 except B class.

  java -ea:pack1...-da:pack1.B.

Note: - we can enable of disable assertions either class wise of paeleage wise also.

5.Appropriate and Inappropriate use of assertions:

- 1). It is always inappropriate to mix programming legic with assert statements becox there is no guarantee for the execution of assest statement always at suntime.
- Ez: withdraw (double amount)

  {
   if (amount < 100)

wittsdraw (double amount)

assert (amount>=100);

nc):

process request

throw new Illegal Argund EM (Inception C); else

Enappropriate

process request

Appropriate

e) While performing debugging in our program if there is any place where control is not allowed to reach that is the best place to use assertions.

en: switch (a)

Lave 1: S.o.p ("JAN");

should be a valid

break;

month number

case 2: S.o.p ("FEB");

break; default: assert (false);

Re: Assertion Error)

SCJP MATERIA

- 3) It is always inappropriate to use assertions for validating public method arguments becoz outside person doesn't aware whether assertions are enabled or disabled in our system.
- 4) It is always, to use assertions for validating private method arguments becox local person can aware whether assertions are enabled or disabled in our system.
- 5) It is always inappropriate for validating command line arguments by using assertions becox there are arguments to public main() method.

Ez: class Test

[public] Static void main (String [] args)

assert (args. length >= 3)

Enappropriate usage of DEMO est statement

- 6) Assertion Error:
- -> It is the child class of Error and hence it is unchecked.
- -> It will be raised whenever assert statement fails.
- Eventhough it is legal to catch Assertion Error but it is never recommonded. It is a stupid kind of programming practice.

En: class Test

PS Vm(-)

Ent n=10;

1 assert (a>10);

catch (Assertion Error e)

{
