DURGA SOFTWARE SOLUTIONS

SCJP MATERIAL

Inner dans:

- -> Sometimes we can declare a class inside another class such type of classes are called <u>Enner classes</u>.
- -> Inner classes concept introduced in 1.1 version to fix GUI Bugs as the part of Event Handling
- -> But becoz of powerful features and benefits of Inner classes Slowly programmers are started using in regular coding also.
- Nithout existing one type of object if there is no chance of existing another type of object" then we should go for <u>Inner classes</u>.

EZO: University consists of several departments. Without existing University there is no chance of existing Department.

Hence Department is the part of University and we have to declare Department class EIMOde University class.

class University Outer class

class Department Times class

d

=

y

En@: Without existing Bank object there is no chance of existing Account object.

Hence we have to declare Account class înside Bank class.

class Bank
L class Account
L =

Er3: Map is a collection of key-value paids and each keyvalue pair is called an Entoy.

Hence Map is considered as a collection of Entry Objects. Without existing Map object there is chance of existing Map

Object. Hence interface Entry is defined inside Map interface.

interface Map Duter interface

Note (1):- Without existing Outer class object there is no chance of existing Inner class object.

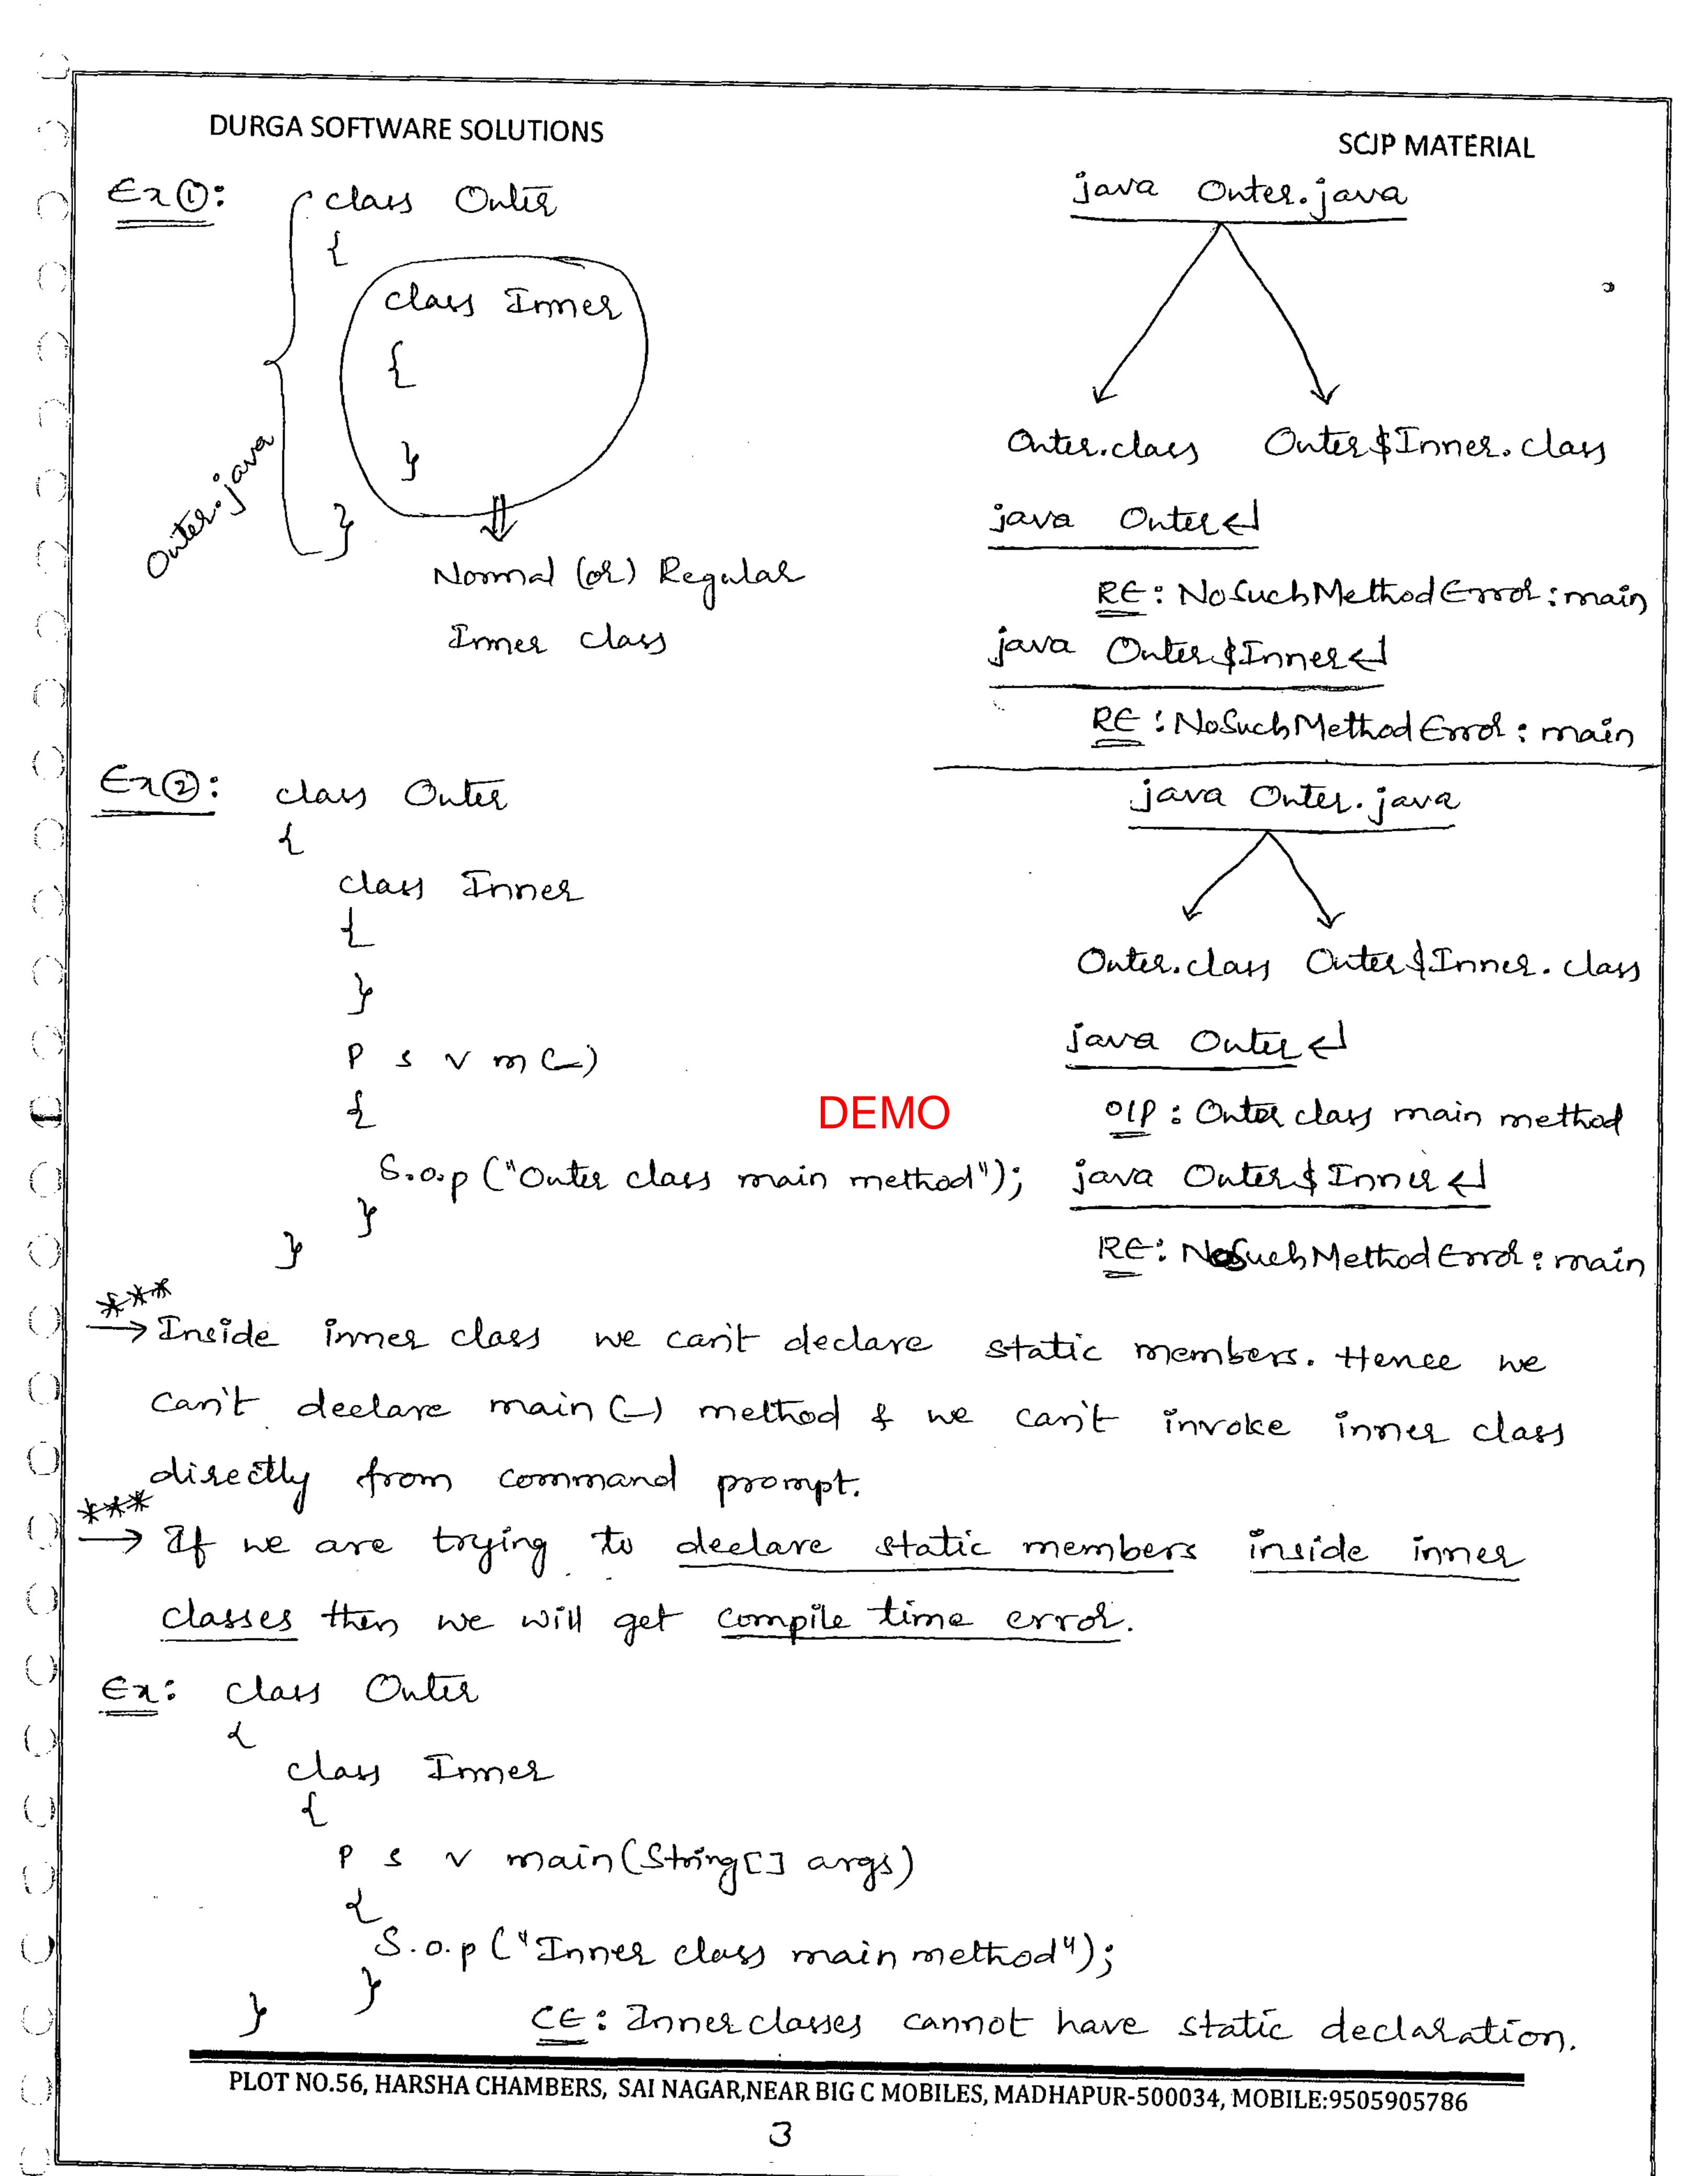

- 1 The relationship blu Outer class & Inner class is not parent to child relationship. Et is Has-A relationship (Composition Aggregation).
- -> Based on purpose & position of declaration all Inner classes are divided into a types.
 - 1. Normal (or) Regular Inner classes
 - 2. Method Local Inner classes
 - 3. Anonymous Inner classes

1. Normal (ch) Regular Inner classes :

T. Static Nested classes:

Normal (or) Regular Inner classes:

> 2f we are declaring any named class directly without static modifier such type of inner class is called Normal (or) Regulas Inner class.

```
SCIP MATERIAL
 Accessing Inner class code from Static area of Outer class:
             public void m1()
              de Soop (" 2 mer class method");
              S V m (__)
             Outer o = new Outer (); Outer . Inner i = Outer . Inner i = new Outer .); rew Outer .);
             (l. m1(); => off: Inner class method
                new Outer(). new Inner(). m1();
Case iii: Accessing Inner class code from instance area of Onter class:
       clais Outer
         class Inner
            public void m1()
              S-o.p ("Inner class method");
           public void m2()
             Inner i=new Inner();
              1. m11);
                                          011: Inner class method
              Outer 0=new Outer ();
              0. m2();
```

```
DURGA SOFTWARE SOLUTIONS
```

SCJP MATERIAL

caselli): Accessing Inner class code from outside of Outer class:

ez: class Outer

class Inner

{
 public void m10)

d
 S.o.p("Inner class method");
}

class Test

011 : Inner class method.

r Onter o=new Onter();

Outer. Inner 1=0. new Innerc);

7 i. m1()

DEMO

Accessing Prince class code

From static area of Outer class
(or)

From outside of Outer class

Outer 0= new Outer(1);

Outer. Inner i=0. new Emercs; i. m1(1; From instance area of Outer class

Enner i=new Inner();
i. m1();

```
DURGA SOFTWARE SOLUTIONS
```

SCJP MATERIAL

-> From Normal (Or) Regular Inner class, we can access both static & non-static members of Outer class directly.

in: class Outa

lint n=10;

Static int y=20;

class Inner

public void m1()

{

| S.o.p(n); => olf:10

| S.o.p(y); => olf:20

}

P s v m(-)

Couter o=new Outacl);

Outer o=new Outacl);

Outer . Enner i=0. new Inner();

-> Within the Ermer class this always refers current Inner class object.

But to refer current Outer class object we have to use

Outer_class_name.this

int n=10;

Class Inner

int n=100;

public void m1();

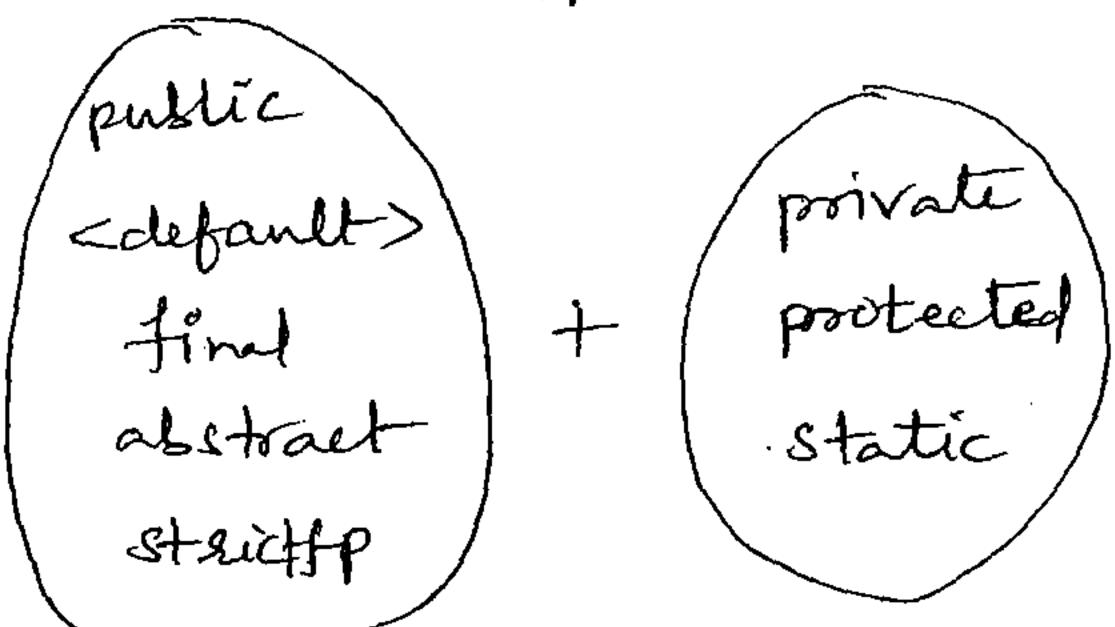

int n=1000;

S.o.p(an; =) olf:1000 (or) y S.o.p (Inner othis.a); (S.o.p (this.a);) => olp:100

y | y S.o. p Conter. this on); => 216:10

-> The only applicable modifiers for top level classes (Outer classes) are public, addfault >, final, abstract of stractofp.

But for Inner classes applicable modifiers one

Nesting of Inner classes:

-> We can declare Inner class inside Inner class i.e., nesting of Inner classes is possible.

ea: class A

oss C

public void m1()

Sop ("Inner most class method")5

Ps (-)

(A a = new AC);

A.13 b=a.new BC);

A.B.C c=bonew CU;

comaci;

>(new Ac). new BL). new CC). m1();

(A.B.C c=new Ac). new Bc). new C();)|

Olp: Inner most class method

- 2. Method Local Inner Classes:
- -> Sometimes we can declare a class inside a method such type of Inner classes are called Method Local Inner classes.
- The main purpose of Method lexal inner classes is to define method specific repeatedly required for ality.
- -> Method local inner classes one best suitable to handle nested method requirements.
- -> We can access Method local inner classes only inside the method in which we declared it i.e., from outside the method we can't access.
- -> Hence Method local inner classes one most rarely used type of Ermer classes (beeox their scope is very less).

Ex: class Outer

{

public void M1() DEMO

{

class Inner

public void sum(int x, int y)

{

{

Secol(2+4):}

Innel i = new Innel();

i. sum (10,20); =) 0/1 : 30

i. Sum (100, 200); => 011:300

i. sum (1000, 2000); =1011:3000

P s v m (...)

Tæst t=new Testc);

pt.m1-();

```
Ne can declare Inner class inside both instance & static methods.

The we declare inside instance method then we can access both
   Static & non-static members of Outer class directly.
) It we declare inside static method then we can access only
   Static members of Outer class from that Method local inner class.
          int 7=10;
          static int y=20;
          public void mac)
             class Inner
               public void m2()
                 C-0.p(a); =) 0[p: 10
                S. o.p (4); => OIP :20
DEMO
                Enner i = new Inner();
                1. m2();
```

Jet we declare mich method as static then at line() we will get compile time error saying non-static variable in connect be referenced from a static content.

Test tenew Testes;

From Method local inner class we can't access local variables of the method in which we declared that inner class.

the method in which we declared that inner class.

But if that local variable declared as final then we can accept.

```

- Q: Et ne declare m1() method as static then at line() which variables we can access?
 - i) i ×
 - 2) j
 - 3) k x
 - 4) 1
- Q: Et we declare m21, method as static then at line() which variables we can access?

Ans: We will get CE becoz Ermer classes can't have static declarations.

The only applicable modifiers for Method local inner classes one

final, abstract & strict-fp.

- 3. Anonymous Inner Classes:
 - -> Sometimes we can declare inner class without name such type of inner classes are called Anonymous Permer classes.
 - The main purpose of Arrongmous Inner classes is just for instant use (1 time usage).
 - There are 3 types of Anonymons Inner classes.
 - 1. Anonymous Inner class that extends a class
 - 2. Anongmous Inner class that implements an interface
 - 3. Anonymous Inner class that defined inside aiguments.
 - 1. Anonymous Ennie class that entends a class:

Ea: class PopCorn

L

public void taste()

{
 S.o.p("Salty");
}

1 100 more methods

```
class Test
    PopCorn p=new PopCornc)
       public void tastel)
      P. taste (); = ) Old: Spicy
      Pop Corn P_= new Pop Corn ();
      n. tastec); = olp: Salty
      Pop Corn 1/2 = new Pop Corn()
        public void taste ()
         S.o.p ("Sweety);
      P2. taste();=> OLP: Sweet
```

Analysis:

1. PopColn p=new PopColn();

-> we are creating just PopColn object.

2. PopCorn p=new PopColn()

رُ کُلُ

-> We are creating child class for PopCorn without name (Anony-mony Immer Class).

-> For that child class we are creating an object with parent reference.

```
3. PopColn p=new PopColn()

{

public void taste()

{

S.o.p("Spig");
}
```

- -> We are creating child class for PopCorn Without name (Anonymous Inner class).
- The child class, we are overliding taster, method for that child class we are creating an object with parent reference.

2. Anonymous Ermer class that implements an interface:

En: class Test

2
PSVm(-)

```
Rumable l=new Runnable()

public void run()

for (int i=0; i<10; i++)

| S.o.p("child Thread");

y

Thread t=new Thread();

t. start();

for (int i=0; i<10; i++)

& S.o.p("main Thread");

y

y
```

3. Anonymous Inner class that define inside orguments:

En: class Test

ps ~ m(-)

new Thread (new Rumable ()

public void ounc)

If for (int i=0; i < 10; i++)

If S. o.p ("child Thread");

If or (int i=0; i < 10; i++)

If S. o.p ("main Thread");

y >

Anonymous Inner class vi Normal class:

- Anonymous Inner class also can extend only one class at a time, but

 Anonymous Inner class also can extend only one class out a time.
- A Normal Java class can implement any no. of interfaces at a time, but Anonymous Inner class can implement only one interface at a time.
- A Hormal Java class can entend a class and can implement any no. of interfaces simultaneously, but Anonymous Inner class can extend a class of implement an interface simultaneously.
- extend a class & implement an interface simultaneously.

 The main application area of Anonymous Innex classes is to implement QUI based applications for Event Handling.

impost java. awt. *;

impost java. awt. event. *;

public class JasDemo DEMO

if s v m()

frame f=new framet);

f.addWindowkistener(new WindowAdapter())

i public void windowClosing (WindowEvent e)

i system. exit(o);

j);

f.add(new Label ("I can create Executable Jar File!!!"));

f. set Size (500, 500);

f. Set-Visible (true);

EZO: class SomeGUI extends JFrame

b2. add Action Listener (new Action Listener ()

public void autionPerformed (Action Event e)

[2 11 perform our required operation

[3]

3);

}

DEMO

4. Static Mested classes:

- -> Sometimes ne can declare inner class with static modifier such type of inner classes are called Static Nested classes.
- -> En Normal (d.) Regular Inner class, without existing Outer class object there is no chance of existing Inner class object.
- -> But in case of Static Nested classes, without existing Outer class object there may be a chance of existing static Nested class object i.e., Nested class object is not strongly associated with Outer class object.

En: class Test & static class Nested.

```
DURGA SOFTWARE SOLUTIONS
                                                        SCIP MATERIAL
        pulstic void m1()
        L S.o.p ("Static Nested class method");
        11 Test. Nested n=new Test. Nestedl); (outside of the class)
         Nested n=new Nested();
-> In Wohnal of Regular Inner classes, ne can't take static decla-
```

vations, but in Static Nested classes we can take static declalations including main (_) method also.

we can invoke static Nested class directly from command

Static class Nested S.o.p("Static Nested class method"); ~ m(__) S.o. p ("Outer class main method");

javac Test. java Test. Class Test & Nested"

java Test (Olp: Onter class main method.

java Test \$ Nested

Olp: Static Nested class main method.

> From Normal (or) Regular Irmer dans, we can access both static & non-static members of Outer class directly.

-> But from Static Nested class, we can access only static members

of Outer class directly.

int a=10; static int y=20; Static class Nested $S.o.p(a); \longrightarrow \underline{cc}:$ S.o.p(y);

Hw Normal Ennee Class of Static Mested Class!

Normal Inner class

1. Without existing Onter dans object 1. Without existing Outer dans object there is no chance of existing Inner DEMO may be a chance of existing class object i.e., 2 mer class object Static Nested class Object i.e., Static is strongly associated with Outer class Nested class object is not strongly object (Composition).

- static declarations are not allowed. 3. In Normal Anner class, ne can't declare main (_) method of hence we
- eanit invoke inner class directly from command prompt.
- 4. From Normal Inner class, we can access both static 4 non-estatic members of Onter class directly.

Static Mested Class

non-static variable a cannot be referenced from a static content.

associated with Onter class object (Aggregation).

- 2. In Normal (or) Regular Anner classes, 2. In Static Nested classes, we can declare static members.
 - 3. In Static Nested classes, ne can declare static members 4 hence we can invoke static Nested class directly from and prompt.
 - 4. From Static Nested Classes, we can access only static members of Outer class directly.

DURGA SOFTWARE SOLUTIONS

Various Possible Combinations of classes and

- -> Wiltout existing one type of object if there is no chance of existing another type of object then we can declare a class inside
- Class Department
- -> Without existing University object there is no chance of existing Department object.
- Hence he have to define Department class inside University class.
 - 2. interface incide a class:
- -> Inside a class, if we require multiple implementations of an interface & these implementations are relavant to a particular class then we can define an interface inside a class.

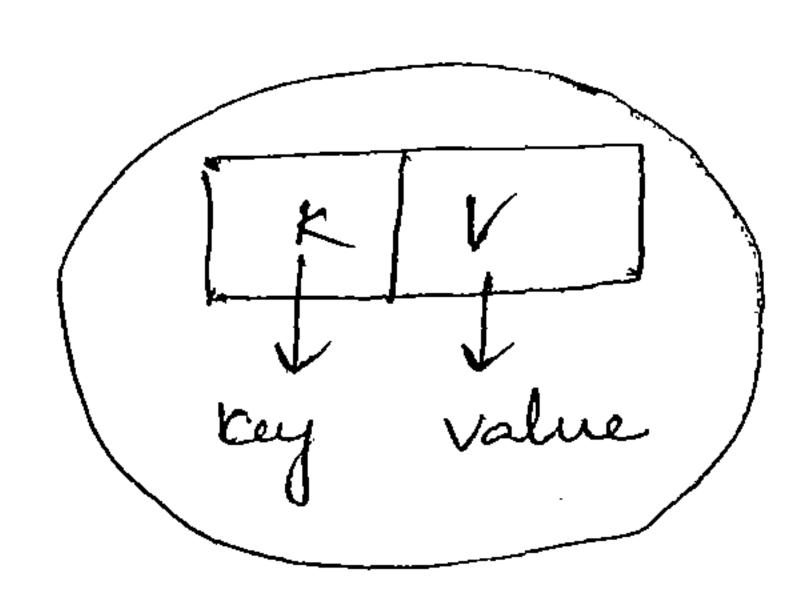

VeehicleType

interface Vechicle public int getNoOfWheely (); class Bus implements Vehicle public int get NoOfletheels () class Auto implements Veehicle public int get NeOf Wheels () L' return 3°, 3. interface inside interface

-> we can declare interface inside interface.

interface

interface Entry public Object get Key (1; public Object getValue(); public Object setValue (Object 0);

Every inner interface is always static.

-> Hence we can implement Inner interface directly without implementing Outer interface.

-> whenever ne are implementing Outer interface ne are not required to implement Inner DENTOTALE i.e., Outer of Inner interfaces we can implement Independently.

nterface Outer

public void interface Inner

public void m2C1;

class Tests implements Outer. Inner

pullic void

S.o.p ("Inner interface method");

class Test2 implements Outer public void m1() d S.o.p("Outer interface method");

4. dans incide interfale

-> Et a class functionality is closely associated with the use of interface then it is highly recommended to declare that class inside interface.

interface Email Service

public void sendMail (EmailDetails e);

class EmailDetails

private String to-list;

private String entject;

private String ce-list;

In the above example, Email Details thality is required for Email Service of we are not using anywhere else.

- Hence it is highly recommended to declare Email Details class inside Email Service interface.
 - -> We can also declare a class inside interface to provide defaultimplementation for that interface.

ez: înterface Vechicle

Lepublic int getNoOfWheels();

class DefaultVeehicle implements Vehicle

public int getNoOfWheels()

description 2;

elass Bus implements Vehicle

public int getNoOfWheels()

telurn 4;

In the above example, DefaultVechicle is the default implementation of Vechicle interface where as Bus is customized implementation of Vechicle interface.

Veehicle interface.

Note: - Every class which is declared inside interface is always

public static. whether we are declaring or not.

Hence ne can create object directly without implementing interface & without creating an instance of interface type.

Conclusions:

DEMC

-> we can declare anything inside anything.

class X class X interface X L

class Y to the state Y class Y

L

y

y

interface X
interface Y
L

-> Nested înterfaces are always static, but Nested class need not be static always.
